Communicated by J. Brzdęk

Abstract. In this work, by considering a general subclass of univalent functions and using the Chebyshev polynomials, we obtain coefficient expansions for functions in this class.

1. Introduction and Definitions

Let \( D \) be the unit disk \( \{ z \in \mathbb{C} : |z| < 1 \} \), and let \( A \) be the class of all analytic functions on \( D \), satisfying the conditions
\[ f(0) = 0 \text{ and } f'(0) = 1. \]
Then each function \( f \) in \( A \) has the Taylor expansion
\[ f(z) = z + \sum_{n=2}^{\infty} a_n z^n. \tag{1.1} \]

Further, by \( S \) we shall denote the class of all functions in \( A \) which are univalent on \( D \).

If the functions \( f \) and \( g \) are analytic on \( D \), then \( f \) is said to be subordinate to \( g \), written as
\[ f(z) \prec g(z), \quad (z \in D) \]
if there exists a Schwartz function \( w(z) \), analytic on \( D \), with
\[ w(0) = 0 \text{ and } |w(z)| < 1 \quad (z \in D) \]

Key words and phrases. Chebyshev polynomials; Analytic and univalent functions; coefficient bounds; subordination.
such that
\[ f(z) = g(w(z)) \quad (z \in D). \]
Denote by \( K \) the subclass of \( S \) consisting of convex functions, so that \( f \in K \) if and only if for \( z \in D \)
\[ \Re \left( 1 + \frac{zf''(z)}{f'(z)} \right) > 0. \]

The Fekete-Szegö functional \(|a_3 - \mu a_2^2|\) for normalized univalent functions
\[ f(z) = z + a_2 z^2 + \cdots \]
is well known for its rich history in the theory of geometric functions. Its origin
was in the disproof by Fekete and Szegö of the 1933 conjecture of Littlewood and
Paley that the coefficients of odd univalent functions are bounded by unity (see
[3]).

Chebyshev polynomials have become increasingly important in numerical anal-
ysis, from both theoretical and practical points of view. There are four kinds of
Chebyshev polynomials. The majority of books and research papers dealing with
specific orthogonal polynomials of Chebyshev family, contain mainly results of
Chebyshev polynomials of first and second kinds \( T_n(x) \) and \( U_n(x) \) and their nu-
merous uses in different applications, see for example, Doha [2] and Mason [4].

The Chebyshev polynomials of the first and second kinds are well known. In
the case of a real variable \( x \) in \((-1, 1)\), they are defined by
\[ T_n(x) = \cos n\theta, \]
\[ U_n(x) = \frac{\sin(n+1)\theta}{\sin \theta}, \]
where the subscript \( n \) denotes the polynomial degree and where \( x = \cos \theta \).

**Definition 1.1.** A function \( f \in A \) is said to be in the class \( K(\lambda, t) \), \( \lambda \geq 0 \) and \( t \in (\frac{1}{2}, 1] \), if the following subordination hold
\[ (1 - \lambda) \frac{zf'(z)}{f(z)} + \lambda \left( 1 + \frac{zf''(z)}{f'(z)} \right) \prec H(z, t) := \frac{1}{1 - 2t z + z^2} \quad (z \in D). \quad (1.2) \]

We note that if \( t = \cos \alpha, \alpha \in (-\frac{\pi}{3}, \frac{\pi}{3}) \), then
\[ H(z, t) = \frac{1}{1 - 2t z + z^2} \]
\[ = 1 + \sum_{n=1}^{\infty} \frac{\sin(n+1)\alpha}{\sin \alpha} z^n \quad (z \in D). \]
Thus
\[ H(z, t) = 1 + 2 \cos \alpha z + (3 \cos^2 \alpha - \sin^2 \alpha)z^2 + \cdots \quad (z \in D). \]
Following [5], we write
\[ H(z, t) = 1 + U_1(t) z + U_2(t) z^2 + \cdots \quad (z \in D, \ t \in (-1, 1)), \]
where \( U_{n-1} = \frac{\sin(n \arccos t)}{\sqrt{1 - t^2}} \) \((n \in \mathbb{N})\) are the Chebyshev polynomials of the second kind. Also it is known that

\[ U_n(t) = 2tU_{n-1}(t) - U_{n-2}(t), \]

and

\[ U_1(t) = 2t, \]
\[ U_2(t) = 4t^2 - 1, \]
\[ U_3(t) = 8t^3 - 4t, \]
\[ \vdots \]

The Chebyshev polynomials \( T_n(t), \ t \in [-1, 1], \) of the first kind have the generating function of the form

\[ \sum_{n=0}^{\infty} T_n(t)z^n = \frac{1 - tz}{1 - 2tz + z^2} \quad (z \in D). \]

However, the Chebyshev polynomials of the first kind \( T_n(t) \) and the second kind \( U_n(t) \) are well connected by the following relationships

\[ \frac{dT_n(t)}{dt} = nU_{n-1}(t), \]
\[ T_n(t) = U_n(t) - tU_{n-1}(t), \]
\[ 2T_n(t) = U_n(t) - U_{n-2}(t). \]

In this paper, motivated by the earlier work of Dziok et al. [1], we use the Chebyshev polynomial expansions to provide estimates for the initial coefficients of univalent functions in \( K (\lambda, t) \).

2. COEFFICIENT BOUNDS FOR THE FUNCTION CLASS \( K (\lambda, t) \)

**Theorem 2.1.** Let the function \( f(z) \) given by (1.1) be in the class \( K (\lambda, t) \). Then

\[ |a_2| \leq \frac{2t}{1 + \lambda} \]

and

\[ |a_3| \leq \frac{(2\lambda^2 + 10\lambda + 4)\lambda t^2}{(1 + 2\lambda)(1 + \lambda)^2} + \frac{t}{1 + 2\lambda} - \frac{1}{2(1 + 2\lambda)}. \]

**Proof.** Let \( f \in K (\lambda, t) \). From (1.2), we have

\[ (1 - \lambda) \frac{zf''(z)}{f'(z)} + \lambda \left( \frac{zf'(z)}{f''(z)} \right) = 1 + U_1(t)w(z) + U_2(t)w^2(z) + \cdots, \quad (2.1) \]

for some analytic function \( w \) such that \( w(0) = 0 \) and \( |w(z)| < 1 \) for all \( z \in D \). From the equalities (2.2) and (2.3), we obtain that

\[ (1 - \lambda) \frac{zf''(z)}{f'(z)} + \lambda \left( \frac{zf'(z)}{f''(z)} \right) = 1 + U_1(t)c_1z + [U_1(t)c_2 + U_2(t)c_1^2] z^2 + \cdots. \tag{2.2} \]

It is fairly well-known that if \( |w(z)| = |c_1z + c_2 z^2 + c_3 z^3 + \cdots| < 1, \ z \in D, \) then

\[ |c_j| \leq 1, \quad \text{for all } j \in \mathbb{N}; \quad (2.3) \]

and

\[ |c_2 - \mu c_1^2| \leq \max \{1, |\mu|\}, \quad \text{for all } \mu \in \mathbb{R}. \tag{2.4} \]

It follows from (2.2) that

\[ (1 + \lambda) a_2 = U_1(t)c_1, \]
\[ 2 (1 + 2\lambda) a_3 - (1 + 3\lambda) a_2^2 = U_1(t)c_2 + U_2(t)c_1^2. \tag{2.6} \]
From (1.3) and (2.5) we obtain
\[ |a_2| \leq \frac{2t}{1 + \lambda}. \] (2.7)

Next, in order to find the bound on $|a_3|$, by using (2.5) in (2.6), we obtain
\[ 2 (1 + 2\lambda) a_3 = U_1(t)c_2 + \left\{ U_2(t) + \frac{(1 + 3\lambda)}{(1 + \lambda)^2}U_1^2(t) \right\} c_1^2 \] (2.8)

Then, in view of (1.3) and (2.3), we have from (2.8)
\[ |a_3| \leq \frac{(2\lambda^2 + 10\lambda + 4) t^2}{(1 + 2\lambda)^2} + \frac{t}{1 + 2\lambda} - \frac{1}{2(1 + 2\lambda)}. \]

3. Fekete-Szegő inequalities for the function class $K(\lambda, t)$

**Theorem 3.1.** Let $f$ given by (1.1) be in the class $K(\lambda, t)$. Then
\[ |a_3 - \mu a_2^2| \leq \begin{cases} \frac{t}{1 + 2\lambda}, & \mu \in [\mu_1, \mu_2] \\ \frac{t}{1 + 2\lambda} \left| \frac{4t^2-1}{2t} + \frac{2(1+3\lambda)}{(1+\lambda)^2} t - 4\mu \frac{(1+2\lambda)}{(1+\lambda)^2} t \right|, & \mu \notin [\mu_1, \mu_2] \end{cases} \]
where
\[ \mu_1 = \frac{4t^2(\lambda^2+5\lambda+2)-(1+\lambda)^2(1+2t)}{8(1+2\lambda)t^2}, \quad \mu_2 = \frac{4t^2(\lambda^2+5\lambda+2)-(1+\lambda)^2(1+2t)}{8(1+2\lambda)t^2}. \]

**Proof.** From (2.5) and (2.8)
\[ |a_3 - \mu a_2^2| = \frac{U_1(t)}{2(1 + 2\lambda)} \left| c_2 + \left\{ \frac{U_2(t)}{U_1(t)} + \frac{1+3\lambda}{(1+\lambda)^2}U_1^2(t) - 2\mu \frac{(1+2\lambda)}{(1+\lambda)^2} U_1(t) \right\} c_1^2 \right|. \]

Then, in view of (2.4), we conclude that
\[ |a_3 - \mu a_2^2| \leq \frac{U_1(t)}{2(1 + 2\lambda)} \max \left\{ 1, \left| \frac{U_2(t)}{U_1(t)} + \frac{1+3\lambda}{(1+\lambda)^2}U_1^2(t) - 2\mu \frac{(1+2\lambda)}{(1+\lambda)^2} U_1(t) \right| \right\}. \] (3.1)

Finally, by using (1.3) in (3.1)
\[ |a_3 - \mu a_2^2| \leq \frac{t}{1 + 2\lambda} \max \left\{ 1, \left| \frac{4t^2-1}{2t} + \frac{2(1+3\lambda)}{(1+\lambda)^2} t - 4\mu \frac{(1+2\lambda)}{(1+\lambda)^2} t \right| \right\}. \]

Because $t > 0$, we have
\[ \left| \frac{4t^2-1}{2t} + \frac{2(1+3\lambda)}{(1+\lambda)^2} t - 4\mu \frac{(1+2\lambda)}{(1+\lambda)^2} t \right| \leq 1 \]
\[ \iff \left\{ \frac{4t^2(\lambda^2+5\lambda+2)-(1+\lambda)^2(1+2t)}{8(1+2\lambda)t^2} \leq \mu \leq \frac{4t^2(\lambda^2+5\lambda+2)-(1+\lambda)^2(1+2t)}{8(1+2\lambda)t^2} \right\} \]
\[ \iff \mu_1 \leq \mu \leq \mu_2 \]

Taking $\lambda = 1$ in the above theorem we get the following corollary.
Corollary 3.2. If \( f \in K(t) \), then
\[
|a_2| \leq t;
\]
\[
|a_3| \leq \frac{4t^2}{3} + \frac{t}{6} - \frac{1}{6};
\]
\[
|a_3 - \mu a_2^2| \leq \begin{cases} 
\frac{t}{3}; & \mu \in [\mu_1, \mu_2] \\
\frac{8t^2 - 1 - 6\mu^2}{6}; & \mu \notin [\mu_1, \mu_2]
\end{cases}
\]
